

# ***PHP WITH MYSQL LAB [BCAC 591]***

## ***Practical Assignment***

**Name: ANKITA KABIRAJ**

**Roll Number: 23442724080**

**Registration Number: 242341010006**

**Course: Bachelor of Computer Application**

**Subject: PHP WITH MYSQL LAB [BCAC 591]**

**Teacher's Name: Majid Mallik**

**Department: NSHM Institute of Computing &  
Analytics**

**College Name: NSHM Knowledge Campus,  
Kolkata**

## **INDEX**

| SERIAL NO. | PROBLEM STATEMENT                                                                                                                                                                                                                                          | PAGE NO. |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1          | Write a PHP script to get the PHP version and configuration information.                                                                                                                                                                                   | 1        |
| 2          | Create a simple HTML form and accept the user name and display the name through PHP echo statement.                                                                                                                                                        | 1 – 3    |
| 3          | Write a PHP script to get the client IP address                                                                                                                                                                                                            | 3 – 4    |
| 4          | Write a simple PHP browser detection script.<br><i>Sample Output: Your User-Agent is: Mozilla/5.0 (Windows NT 6.1) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/35.0.1916.114 Safari/537.36</i>                                                           | 4 – 5    |
| 5          | Write a PHP script to get the current file name.                                                                                                                                                                                                           | 5        |
| 6          | Write a PHP script, which will return the following components of the url 'https://www.w3resource.com/php-exercises/php-basic-exercises.php'                                                                                                               | 5 – 6    |
| 7          | Write a PHP script, to check whether the page is called from 'https' or 'http'.                                                                                                                                                                            | 7        |
| 8          | Write a PHP script to redirect a user to a different page.                                                                                                                                                                                                 | 7 – 8    |
| 9          | Write a simple PHP program to check that emails are valid.                                                                                                                                                                                                 | 9 – 10   |
| 10         | Write a PHP script to display string and values within a table.                                                                                                                                                                                            | 10 – 12  |
| 11         | Write a PHP script to get the information about the operating system PHP is running on.                                                                                                                                                                    | 12 – 13  |
| 12         | Write a PHP script to get the last occurred error.                                                                                                                                                                                                         | 13 – 14  |
| 13         | Calculate a number even or odd by user input page.                                                                                                                                                                                                         | 14 – 16  |
| 14         | Calculate and show circumference and area of a circle when radius is given user input in a page.                                                                                                                                                           | 16 – 17  |
| 15         | Calculate the grade of a student marks by user input page.<br>above 800 but less than or equal 1000 => Print<br>above 600 but less than or equal 800 => Print Class II<br>above 400 but less than or equal 600 => Print Class III<br>below 400, Print Fail | 18 – 19  |

|    |                                                                                                                                                                                                                                                                                                                                                            |         |
|----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| 16 | Find the count of a search word from a paragraph by user input page where the paragraph is user input and the search word is user input.                                                                                                                                                                                                                   | 20 – 21 |
| 17 | Create a page of user registration -<br>Full name (Must be two words)<br>Date of birth (must be above 18)<br>Email ID (must a valid email id)<br>Mobile (must be a 10 digit number)<br>Agree to terms and conditions (must be checked)<br>Submit the form and show "successful registration" if it satisfies all conditions. Otherwise show error message. | 22 - 25 |

***Teacher's Signature***

```
<meta name="viewport" content="width=device-width, initial-
scale=1.0">
<title>User Name</title>
</head>
<body>
  <h1>Enter Your Name Below</h1>
  <!-- Form sends the user's name to the same PHP page -->
<form method="post">
  <!-- Input field for user's name -->
  <label>Enter Name:</label>
  <input type="text" name="username"> <br>
  <!-- Submit button -->
  <br> <input type="submit" name="submit" value="Submit">
</form>
<?php
// check whether the form has been submitted
if (isset($_POST['submit'])) {
  // get the name entered by the user
  $name = $_POST['username'];
  // display the name using echo
  echo "<h2> Your Name is: " . $name . "</h2>";
}
?>
</body>
</html>
```

## OUTPUT:

## Enter Your Name Below

Enter Name:

Submit

**Your Name is: ANKITA KABIRAJ**

### 3. Write a PHP script to get the client IP address.

#### CODE:

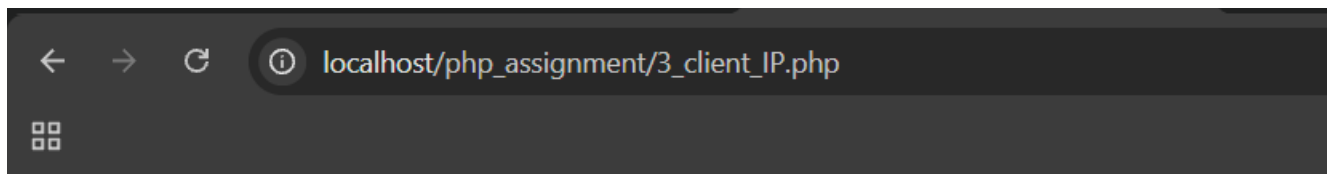

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-
scale=1.0">
  <title>IP Address</title>
</head>
<body>
  <h2>Wants to know your IP Address! Then click the button
below.</h2>
  <form method="post">
    <input type="submit" name="submit" value="Know Your IP
Address">
  </form>
  <?php
  // Check whether the button was clicked
```

```

if (isset($_POST['submit'])) {
    // Get the client's IP address
    $ip = "192.168.31.246";
    // Display the IP address
    echo "<h3>Your IP Address is: " . $ip . "</h3>";
}
?>
</body>
</html>

```

### **OUTPUT:**

**Wants to know your IP Address! Then click the button below.**

Know Your IP Address

**Your IP Address is: 192.168.31.246**

#### **4. Write a simple PHP browser detection script.**

***Sample Output: Your User-Agent is: Mozilla/5.0 (Windows NT 6.1) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/35.0.1916.114 Safari/537.36***

### **CODE:**

```

<?php
// HTTP_USER_AGENT contains information about the user's
// browser, operating system and other client details.
$userAgent = $_SERVER['HTTP_USER_AGENT'];
// Display the User-Agent information
echo "Your User-Agent is: " . $userAgent;
?>

```

## OUTPUT:

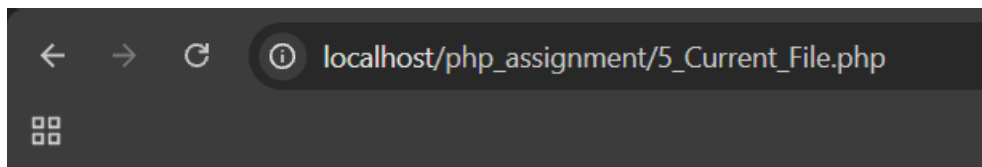

## **5. Write a PHP script to get the current file name.**

### CODE:

```
<?php
// PHP_SELF gives the path of the currently executing PHP file
$filePath = $_SERVER['PHP_SELF'];
// basename() removes the directory path and gives only the file
name
$fileName = basename($filePath);
// Display the current file name
echo "<h2> Current File Name is: " . $fileName. "</h2>";
?>
```

## OUTPUT:

**Current File Name is: 5\_Current\_File.php**

## **6. Write a PHP script, which will return the following components of the url 'https://www.w3resource.com/php-exercises/php-basic-exercises.php'.**

### CODE:

```
<?php

// The URL given in the assignment
```

```
$url = "https://www.w3resource.com/php-exercises/php-basic-exercises.php";
```

```
// parse_url() breaks the URL into different components  
$urlParts = parse_url($url);
```

```
// Display the scheme/protocol  
echo "<h3><b>Scheme</b> : " . $urlParts['scheme'] . "</h3>";
```

```
// Display the host/domain name  
echo "<h3><b>Host</b> : " . $urlParts['host'] . "</h3>";
```

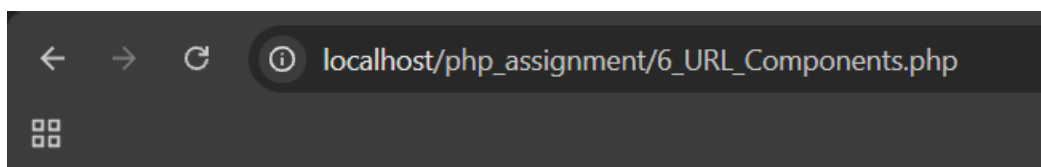

```
// Display the path  
echo "<h3><b>Path</b> : " . $urlParts['path'] . "</h3>";
```

```
// Get only the file name from the path  
$fileName = basename($urlParts['path']);
```

```
echo "<h3><b>File Name</b> : " . $fileName . "</h3>";
```

```
?>
```

### **OUTPUT:**

**Scheme : https**

**Host : www.w3resource.com**

**Path : /php-exercises/php-basic-exercises.php**

**File Name : php-basic-exercises.php**

**7. Write a PHP script, to check whether the page is called from 'https' or 'http'.**

**CODE:**

```
<?php

// Check whether HTTPS is enabled
if (isset($_SERVER['HTTPS']) && $_SERVER['HTTPS'] != 'off') {

    // This block runs when the page is accessed using HTTPS
    echo "<h2>The page is called from HTTPS." . "</h2>";

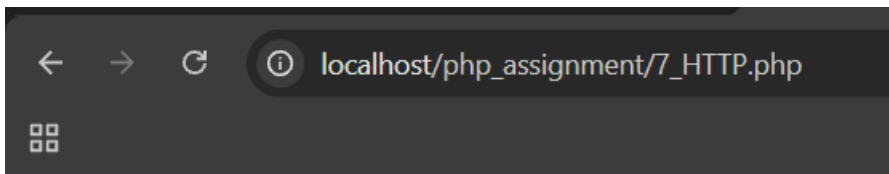

} else {

    // This block runs when the page is accessed using HTTP
    echo "<h2>The page is called from HTTP." . "</h2>";

}

?>
```

**OUTPUT:**

**The page is called from HTTP.**

**8. Write a PHP script to redirect a user to a different page.**

**CODE:**

```
<!DOCTYPE html>
<html>
<head>
```

```
<title>User Name</title>
</head>
<body>

<h2>Welcome!</h2>

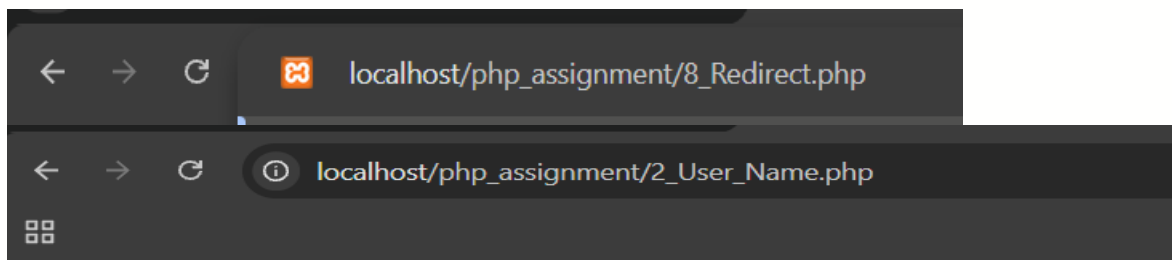

<p><h1>You have been successfully redirected to this
page.</p></h1>
<?php

// Redirect the user to User_Name.php
header("Location: 2_User_Name.php");

// Stop executing the current script after redirection
exit();

?>
</body>
</html>
```

### **OUTPUT:**

## **Enter Your Name Below**

Enter Name:

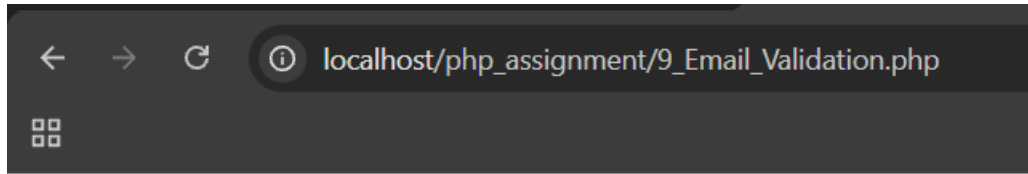

**Your Name is: ANKITA KABIRAJ**

## 9. Write a simple PHP program to check that emails are valid.

### **CODE:**

```
<!DOCTYPE html>
<html>
<head>
    <title>Email Validation</title>
</head>
<body>
<h1>Email Validation</h1>
<form method="post">
    <!-- Input field for email -->
    <label>Enter Your Email:</label>
    <input type="text" name="email">
    <br><br>
    <input type="submit" name="submit" value="Check Email">
</form>
<?php
// Check whether the form has been submitted
if (isset($_POST['submit'])) {
    // Get the email entered by the user
    $email = $_POST['email'];
    // Validate the email format
    if (filter_var($email, FILTER_VALIDATE_EMAIL)) {
        // This runs if the email is valid
        echo "<h2>Valid Email Address." . "</h2>";
    } else {
        // This runs if the email is invalid
        echo "<h2>Invalid Email Address." . "</h2>";
    }
}
?>
</body>
</html>
```

## **OUTPUT:**

## **Email Validation**

Enter Your Email:

**Valid Email Address.**

**10. Write a PHP script to display string and values within a table.**

### **CODE:**

```
<?php
```

```
$name = "Ankita Kabiraj";  
$age = 19;  
$city = "Kolkata";  
$course = "BCA";  
$college = "Bhawanipur Global Campus";  
$subject = "Web Development";  
$language = "PHP";  
$hobby = "Drawing";  
$country = "India";  
$email = "ankita@example.com";  
$semester = "5th Semester";  
$university = "MAKAUT";  
$favoriteFood = "Biryani";  
$favoritePlace = "Himachal Pradesh";  
$goal = "Software Developer";
```

```

echo "<table border='1'>";

echo "<tr><th>Field</th><th>Value</th></tr>";

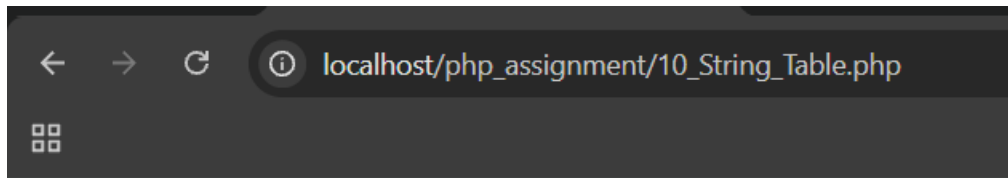

echo "<tr><td>Name</td><td>$name</td></tr>";
echo "<tr><td>Age</td><td>$age</td></tr>";
echo "<tr><td>City</td><td>$city</td></tr>";
echo "<tr><td>Course</td><td>$course</td></tr>";
echo "<tr><td>College</td><td>$college</td></tr>";
echo "<tr><td>Subject</td><td>$subject</td></tr>";
echo "<tr><td>Programming
Language</td><td>$language</td></tr>";
echo "<tr><td>Hobby</td><td>$hobby</td></tr>";
echo "<tr><td>Country</td><td>$country</td></tr>";
echo "<tr><td>Email</td><td>$email</td></tr>";
echo "<tr><td>Semester</td><td>$semester</td></tr>";
echo "<tr><td>University</td><td>$university</td></tr>";
echo "<tr><td>Favorite Food</td><td>$favoriteFood</td></tr>";
echo "<tr><td>Favorite Place</td><td>$favoritePlace</td></tr>";
echo "<tr><td>Career Goal</td><td>$goal</td></tr>";

echo "</table>";

?>

```

## OUTPUT:

| Field                | Value                    |
|----------------------|--------------------------|
| Name                 | Ankita Kabiraj           |
| Age                  | 19                       |
| City                 | Kolkata                  |
| Course               | BCA                      |
| College              | Bhawanipur Global Campus |
| Subject              | Web Development          |
| Programming Language | PHP                      |
| Hobby                | Drawing                  |
| Country              | India                    |
| Email                | ankita@example.com       |
| Semester             | 5th Semester             |
| University           | MAKAUT                   |
| Favorite Food        | Biryani                  |
| Favorite Place       | Himachal Pradesh         |
| Career Goal          | Software Developer       |

**11. Write a PHP script to get the information about the operating system PHP is running on.**

### CODE:

```
<?php
```

```
// php_uname() returns information about the operating system  
$os = php_uname();
```

```
// Display the operating system information  
echo "<h2>Operating System Information: " . $os . "</h2>";
```

```
?>
```

## OUTPUT:

## **12. Write a PHP script to get the last occurred error.**

### CODE:

```
<?php

// Generate an error intentionally for demonstration
echo $undefinedVariable;

// Get information about the last occurred error
$error = error_get_last();

// Check whether an error was found
if ($error != null) {

    // Display the error type
    echo "Error Type: " . $error['type'] . "<br>";

    // Display the error message
    echo "Error Message: " . $error['message'] . "<br>";

    // Display the file where the error occurred
    echo "Error File: " . $error['file'] . "<br>";

    // Display the line number where the error occurred
    echo "Error Line: " . $error['line'];

} else {

    echo "No error occurred.";
```

```
}
```

```
?>
```

## **OUTPUT:**

**Warning:** Undefined variable \$undefinedVariable in C:\xampp\htdocs\php\_assignment\12\_Last\_Error.php on line 4  
Error Type: 2  
Error Message: Undefined variable \$undefinedVariable  
Error File: C:\xampp\htdocs\php\_assignment\12\_Last\_Error.php  
Error Line: 4

## **13. Calculate a number even or odd by user input page.**

### **CODE:**

```
<!DOCTYPE html>
<html>
<head>
    <title>Even or Odd</title>
</head>
<body>

<h1>Check Even or Odd</h1>

<form method="post">

    <!-- User enters a number -->
    <label><h3>Enter a Number:</h3></label>
    <input type="number" name="number">
    <br><br>
    <input type="submit" name="submit" value="Check">

</form>
```

```
<?php

// Check whether the form has been submitted
if (isset($_POST['submit'])) {

    // Convert the input value into an integer
    $number = (int) $_POST['number'];

    // Check whether the number is divisible by 2
    if ($number % 2 == 0) {

        echo "<h2>$number is an Even Number." . "</h2>";

    } else {

        echo "<h2>$number is an Odd Number." . "</h2>";

    }
}

?>

</body>
</html>
```

## OUTPUT:

# Check Even or Odd

Enter a Number:

Check

**8 is an Even Number.**

**14. Calculate and show circumference and area of a circle when radius is given user input in a page.**

## CODE:

```
<!DOCTYPE html>
<html>
<head>
  <title>Circle Calculator</title>
</head>
<body>

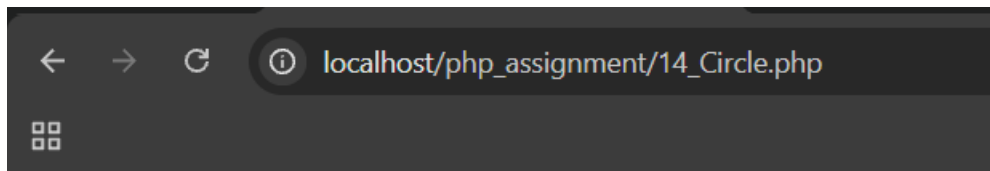

<h1>Circle Circumference and Area</h1>

<form method="post">
  <h3>Enter Radius:</h3>
  <input type="number" name="radius" step="any" required>
  <br><br>
  <input type="submit" name="calculate" value="Calculate">
</form>

<?php
```

```
if (isset($_POST['calculate'])) {  
    $radius = $_POST['radius'];  
    $circumference = 2 * pi() * $radius;  
    $area = pi() * $radius * $radius;  
    echo "<h2>RESULT</h2>";  
    echo "<h3>Radius = " . $radius . "</h3>";  
    echo "<h3>Circumference = " . round($circumference, 2) .  
    "</h3>";  
    echo "<h3>Area = " . round($area, 2) . "</h3>";  
}  
?>  
</body>  
</html>
```

### **OUTPUT:**

## **Circle Circumference and Area**

**Enter Radius:**

Calculate

### **RESULT**

**Radius = 6**

**Circumference = 37.7**

**Area = 113.1**

**15. Calculate the grade of a student marks by user input page.  
above 800 but less than or equal 1000 => Print  
above 600 but less than or equal 800 => Print Class II  
above 400 but less than or equal 600 => Print Class III  
below 400, Print Fail**

**CODE:**

```
<!DOCTYPE html>
<html>
<head>
    <title>Student Grade</title>
</head>
<body>

<h1>Student Grade Calculation</h1>

<form method="post">

    <!-- User enters the total marks -->
    <label><h2>Enter Total Marks:</h2></label></h2>
    <input type="number" name="marks" min="0" max="1000">
    <br><br>
    <input type="submit" name="submit" value="Calculate Grade">

</form>

<?php

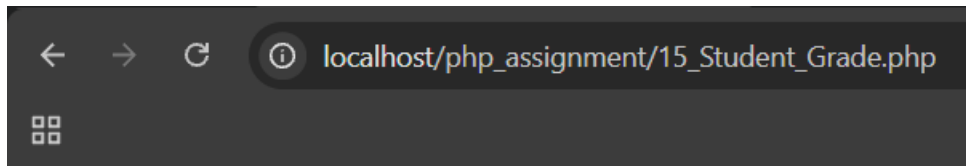

// Check whether the form has been submitted
if (isset($_POST['submit'])) {

    // Convert the input into an integer
    $marks = (int) $_POST['marks'];

    // Check whether marks are within the valid range
    if ($marks > 800 && $marks <= 1000) {
```

```
        echo "<h2>Class I"."</h2>";
    } elseif ($marks > 600 && $marks <= 800) {
        echo "<h2>Class II"."</h2>";
    } elseif ($marks > 400 && $marks <= 600) {
        echo "<h2>Class III"."</h2>";
    } elseif ($marks >= 0 && $marks <= 400) {
        echo "<h2>Fail"."</h2>";
    } else {
        echo "<h2>Invalid Marks"."</h2>";
    }
}
?>
</body>
</html>
```

### **OUTPUT:**

## **Student Grade Calculation**

**Enter Total Marks:**

Calculate Grade

**Class II**

**16. Find the count of a search word from a paragraph by user input page where the paragraph is user input and the search word is user input.**

**CODE:**

```
<!DOCTYPE html>
<html>
<head>
    <title>Word Count</title>
</head>
<body>

<h1>Find Search Word Count</h1>

<form method="post">

    <label><h2>Enter Paragraph:</label></h2>
    <textarea name="paragraph" rows="8" cols="60"
required></textarea>
    <br><br>
    <label><h2>Enter Search Word:</label></h2>
    <input type="text" name="search_word" required>
    <br><br>
    <input type="submit" name="submit" value="Search">

</form>

<?php

if (isset($_POST['submit'])) {

    $paragraph = $_POST['paragraph'];
    $search_word = $_POST['search_word'];

    // Count the search word
```

```

$count = substr_count(strtolower($paragraph),
strtolower($search_word));

echo "<h2>RESULT</h2>";
echo "<b>Paragraph: </b>" . $paragraph . "<br><br>";
echo "<b>Search Word: </b>" . $search_word . "<br><br>";
echo "<b>The word <i><b>" . $search_word . "</i></b> occurs
<i><b>" . $count . "</i></b> times." . "<br>";

}

?>
</body>
</html>

```

## **OUTPUT:**

**Find Search Word Count**

Enter Paragraph:

Enter Search Word:

Search

**RESULT**

**Paragraph:** Technology has become an important part of our daily life. Technology helps students learn new things through online classes, educational websites, and digital libraries. Many businesses also use technology to improve their services and communicate with customers. Although technology makes life easier, it is important to use technology wisely. Proper use of technology can save time, increase productivity, and help people stay connected.

**Search Word:** Technology

The word *Technology* occurs 6 times.

**17. Create a page of user registration -**

**Full name (Must be two words)**

**Date of birth (must be above 18)**

**Email ID (must a valid email id)**

**Mobile (must be a 10 digit number)**

**Agree to terms and conditions (must be checked)**

**Submit the form and show "successful registration" if it satisfies all conditions. Otherwise show error message.**

**CODE:**

```
<!DOCTYPE html>
